

# Quick Start Guide for Nomadix Gateways

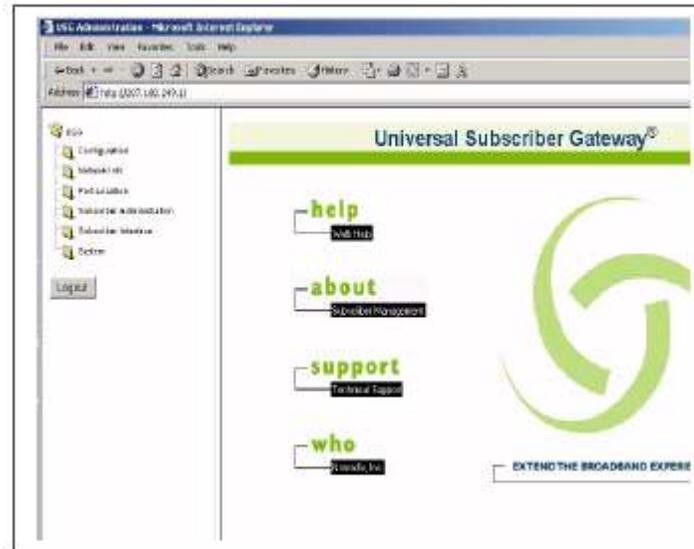

**Version 1.0**  
**Copyright © 2011, Wifi-Soft Solutions**  
**All rights reserved.**

## Purpose of this document

1. This document should be used in conjunction with Nomadix USG user guide for configuring your Nomadix gateway in WiFiLAN. Please refer to WiFiLAN administrator guide and Nomadix user guide for detail documentation
2. It assumes that the user has basic knowledge of networking including configuring subnet mask, RADIUS setting, default gateway and DNS configuration
3. In order to configure Nomadix you will need a static IP address, subnet mask, default gateway and DNS information given to you by your Internet Service Provider. Please keep this information handy while setting up your gateway
4. Configuring Wi-FiLAN you will need the WAN MAC address, RADIUS secret, serial number (if any) and public IP address of your Nomadix gateway
5. Finally, you need an active Wi-FiLAN account. Please contact Wifi-soft's sales to create your Wi-FiLAN account

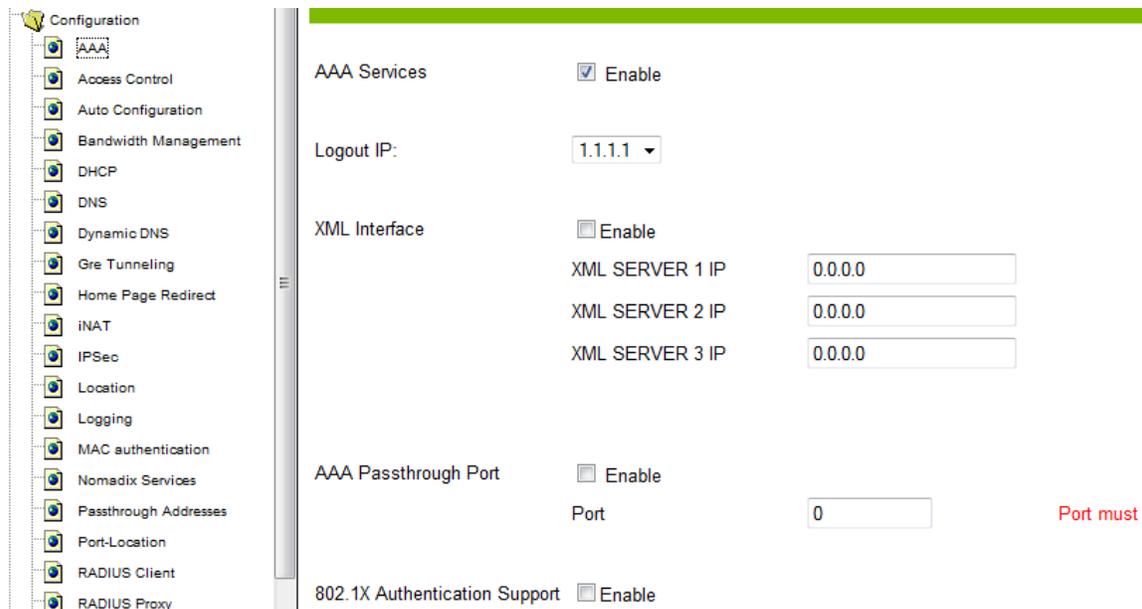

## Nomadix Setup

We have assumed that you have properly connected your Nomadix gateway a broadband connection that has a static public IP address. Additionally, your Nomadix gateway admin interface is accessible either via the LAN interface or via the public WAN interface as shown in the figure below.

Next, you need to click on the Configuration folder listed in the left frame and then on the AAA link.

Make sure that the AAA services link is checked on this tab and the Logout IP is set to 1.1.1.1. Also make sure that the Internal Web Server link is selected as shown below.

Select one of the following:

- Internal Web Server

You must reboot the NSE after turning it on/off

**Note:** To enable, make sure your license includes SSL support and you have all the certificate files on the flash

SSL Support	<input type="checkbox"/> Enable	
Encrypt only Sensitive Data	<input checked="" type="checkbox"/> Enable	
Certificate DNS Name	<input type="text" value=""/>	
Portal Page	<input checked="" type="checkbox"/> Enable	
Portal Page URL	<input type="text" value="https://www.wifi-soft.net/portal/template1.php"/>	
Parameter Passing	<input checked="" type="checkbox"/> Enable	
Manual Passthrough Address	<input type="checkbox"/> Enable	
Portal XML POST URL	<input type="text" value=""/>	
Portal XML Post Port	<input type="text" value="80"/>	
Supports GIS Clients	<input type="checkbox"/> Yes	
Block NWS Login Page	<input checked="" type="checkbox"/> Yes	
Usumames	<input checked="" type="checkbox"/> Enable	
New Subscribers	<input type="checkbox"/> Enable	
ReLogin After Timeout	<input type="checkbox"/> Enable	
Credit Card Service	<input type="checkbox"/> Enable	

Ensure that the Portal Page is enabled. Please enter the URL of the external login page in the Portal Page URL section. The external login page can be either hosted on your web server or Wifi-soft can host it for you.

If you have your own SSL certificate and have uploaded it in the Nomadix gateway, then enter the domain name of the SSL certificate under the certificate DNS name section.

Make sure that Parameter Passing and Usumames checkboxes are enabled. Uncheck New Subscriber checkbox since we are using external mechanism for registering new subscribers.

Save the changes.

Next you need to add a RADIUS server profile for your Nomadix.

To add a new profile, click on the Realm-based Routing option on the left and then click on the Add button in the RADIUS service profile section.

Fill the new profile form with the RADIUS server settings. Please contact Wifi-soft for the correct IP address of your RADIUS server.

Enter the desired secret key. Please remember this key since you will need it while configuring your gateway in Wi-Fi LAN.

Next check the Enable Accounting check box. For RADIUS servers enter the same information and for port number, please enter **1813**.

In retransmission section, make sure that the round-robin is checked and set the Retransmission Delay to 10 seconds and Retransmission Attempts to 2.

**Edit RADIUS Service Profile**

Unique Name:

**Authentication**

Enable RADIUS Authentication Service

Protocol:

Primary	IP / DNS:	<input type="text" value="173.224.125.185"/>	Port:	<input type="text" value="1812"/>	Secret Key:	<input type="text" value="secret"/>
Secondary	IP / DNS:	<input type="text" value="74.208.78.152"/>	Port:	<input type="text" value="1812"/>	Secret Key:	<input type="text" value="secret"/>

**Accounting**

Enable RADIUS Accounting Service

Primary	IP / DNS:	<input type="text" value="173.224.125.185"/>	Port:	<input type="text" value="1813"/>	Secret Key:	<input type="text" value="secret"/>
Secondary	IP / DNS:	<input type="text" value="74.208.78.152"/>	Port:	<input type="text" value="1813"/>	Secret Key:	<input type="text" value="secret"/>

**Retransmission Options**

Retransmission Method:  Failover  Round-Robin

Retransmission Delay:  (seconds)

Retransmission Attempts:  (per server)

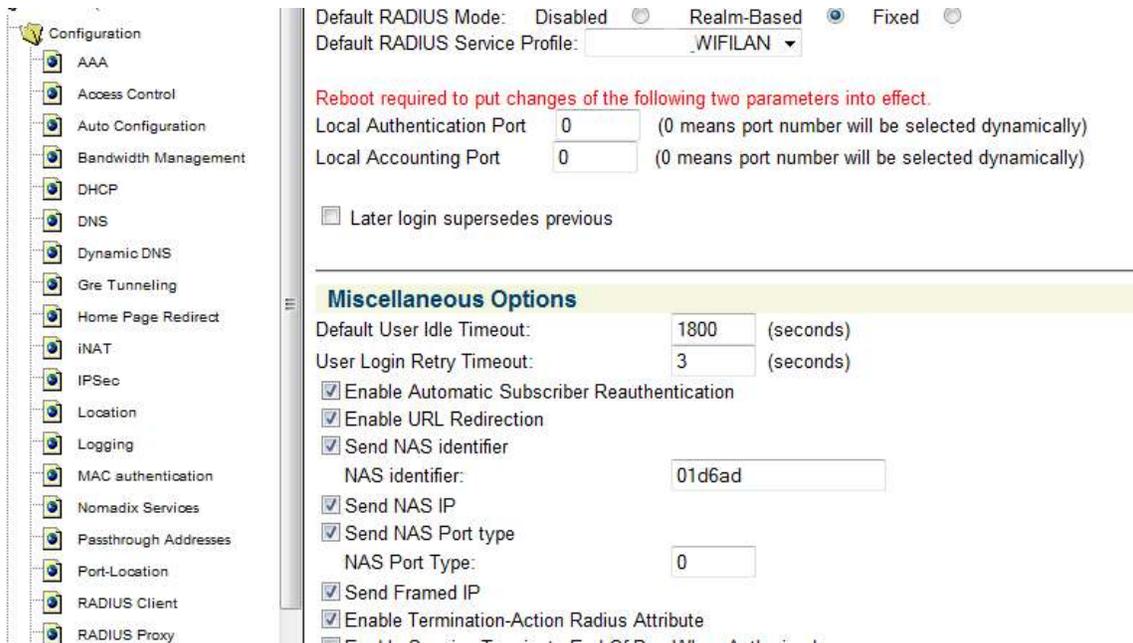

The default RADIUS servers are as follows:

Server Name	IP Address	Authenticaiton Port	Accounting Port
Primary RADIUS server	173.224.125.185	1812	1813
Secondary RADIUS server	74.208.78.152	1812	1813

If your RADIUS servers are different, please enter the ones that Wifi-soft has assigned for you.

Once the profile is configured, you need to enable it under RADIUS client settings.

Click on the RADIUS client menu option on the left. You will see the screen as shown below

Select Realm-Based RADIUS mode and select the newly entered RADIUS service profile from the drop-down list.

Next enable the Miscellaneous options as shown above. If you have a NAS identification scheme, enter the NAS identifier for the controller here.

If you want guest to go to a default post-login (welcome) page, enable URL Redirection.

Next, we need to configure Pass-through addresses for the login portal. Click on the Pass-through Addresses link in the left frame.

Make sure that the Enable checkbox at the top of the page is checked. In the IP/DNS Name, enter the following IP addresses: 173.224.125.185 and 74.208.78.152. You need to add one at a time. Additionally, you also need to add the following pass-through URLs:

[www.wifi-soft.com](http://www.wifi-soft.com)

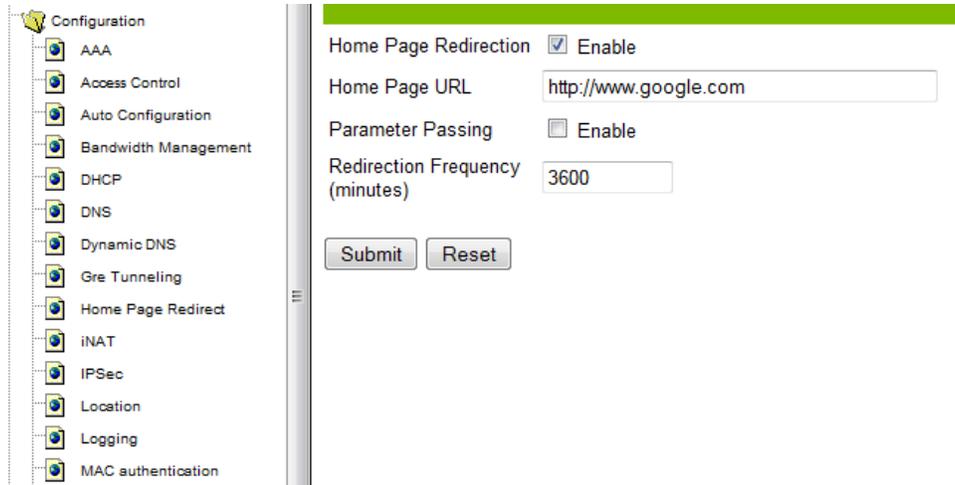

[www.wifi-soft.net](http://www.wifi-soft.net)

Additionally, you can also enter the URL of your website if you want your customers to pass-through without having to authenticate against the RADIUS server.

Lastly, you can configure the post-login or welcome URL for your guest. This page will be displayed to them when they login successfully.

To set the post-login page, click on Home-Page Redirection menu option under Configuration menu and enter the necessary details as shown

The screenshot shows a web-based configuration interface. On the left is a vertical navigation menu with a tree view structure. The 'Configuration' folder is expanded, showing a list of sub-items: AAA, Access Control, Auto Configuration, Bandwidth Management, DHCP, DNS, Dynamic DNS, Gre Tunneling, Home Page Redirect, INAT, IPSec, Location, Logging, and MAC authentication. The 'Home Page Redirect' item is selected. The main content area on the right has a green header bar. Below the header, the 'Home Page Redirection' section is visible. It contains the following settings: 'Home Page Redirection' with a checked checkbox and the label 'Enable'; 'Home Page URL' with a text input field containing 'http://www.google.com'; 'Parameter Passing' with an unchecked checkbox and the label 'Enable'; and 'Redirection Frequency (minutes)' with a text input field containing '3600'. At the bottom of this section are two buttons: 'Submit' and 'Reset'.

## WiFiLAN Setup

1. You need to log into WiFiLAN by pointing your browser to <https://www.wifi-soft.net/wifilan/>
2. Before you add your first gateway in RADIUS section, you need to create a device group to organize your gateways. To create a new device group, click on the RADIUS menu option and then on the Groups submenu.

**New Radius Group**

New Group Information	
Group Name *	wifi-soft
Group Type	device
Description	Device group for wifi-soft gateways
Location	

3. Next you can a location entry for your new hotspot location. Although this step is optional, we highly recommend that you create a location entry since it helps you organize your hotspot locations and generate various location specific reports. To create a new location entry, click on RADIUS menu and then on the Location submenu. You need to click on New Location tab to enter a new location.

**New Location**

Location Information	
Location Name *	Cafe House
Address	120 Range Hill Road
City-State *	Austin - TEXAS <input type="button" value="New"/>
Zipcode	76729
Latitude	
Longitude	
Type	Coffee Shop

4. Once the location entry for your hotspot is created, you may proceed to add your first gateway entry. To add a new gateway, click on the RADIUS menu and then on the Gateway submenu. Click on the New Gateway tab to add a new gateway.

The description of each parameter is as follows:

## New Radius Gateway

Gateway Information	
Device Name *	Cafe House
Device UserName	
Device Password	
IP Address *	24.198.234.7
Secret *	wifi-soft
Device Group *	wifi-soft
Device Type *	Nomadix
MAC Address	00-0C-98-D7-E8-12
Description	Gateway installed at Cafe house
Location	Cafe House
<input type="button" value="Submit"/>	

- Device Name: A friendly name for the gateway
- UserName & Password: Needed for gateways that fetch their configuration from RADIUS server. Optional
- IP Address: Public IP of the gateway
- Secret: The RADIUS secret configured in the gateway
- Device Group: The device group that we created in the previous step
- Device Type: Type of Device
- MAC Address: The MAC address of the WAN port
- Location: The location where the gateway is installed

You may add more information about the gateway in the Network section. Additionally, you can also configure the gateway for 24x7 monitoring by specifying the monitoring parameters as shown below:

Monitoring Information	
Is Monitored	<input checked="" type="checkbox"/>
Monitoring Type	<input checked="" type="radio"/> Ping <input type="radio"/> HTTP <input type="radio"/> SNMP
Monitor Modem	<input checked="" type="checkbox"/>
Modem IP	59.192.181.32 (If different than device IP)
Modem Monitor Type	<input checked="" type="radio"/> Ping <input type="radio"/> HTTP <input type="radio"/> SNMP
Monitoring Interval	15 minutes <input type="text"/> Custom Interval <input type="text"/> (10 mins or more)
Notify Enabled	<input checked="" type="checkbox"/>
Notify After	3 failures
Email Notifications	notify@wifi-soft.com

- **Is Monitored** : Device is monitored if checked
- **Monitoring Type** : Type of protocol used for monitoring
- **Monitoring Interval** : Frequency of monitoring
- **Monitor Modem** : DSL or Cable modem is monitored if checked
- **Modem IP** : The IP address of the modem if different from device IP
- **Modem Monitor Type** : Type of protocol used for monitoring
- **Notify Enabled** : Whether monitoring notification is enabled
- **Notify After** : Number of failure before sending notifications
- **Email Notifications** : List of email address for notification

That's it. You newly configured Nomadix gateway is ready for RADIUS authentication. You may configure the login and welcome URL for your gateway so that user can enter username and password that will be sent to our RADIUS server for authentication. Please contact Wifi-soft on setting up a login page for your gateway.

Please make sure that you use [username@realm](#) as username on your login pages so that it would be easier for you to support roaming in the future.

For more information on creating user accounts, please refer to the Wi-FiLAN administrator guide.
